

Testosterone for Sale

Testosterone ($C_{19}H_{28}O_2$) is the “male hormone”. The brain, the pituitary gland, and the testes must work in perfect harmony to produce adequate amounts of it. If you want to know how to boost testosterone to improve strength, performance, stamina, and muscle mass, or even to combat naturally low testosterone, you have come to the right place. Here you’ll learn everything you need to know before you buy testosterone.

Testosterone Profile: What Is Testosterone?

Testosterone for sale is an androgenic hormone that is responsible for the development of muscles, healthy bones, and strength in both men and women. Low levels of testosterone in either gender can have physical adverse effects, such as a loss of bone density or muscle mass. What’s more, too little testosterone also has a mental effect as it can lead to severe fatigue, loss of libido, and even depression over time. Though commonly known as the “male hormone”, recent studies show that women with too little testosterone in their bodies suffer the same ill effects.

Testosterone binds to proteins in the body known as albumin and globulin, which lie at the surface of muscles. Two hormones, luteinizing (LH) and follicle stimulating hormones (FSH), regulate the production of testosterone in both men and women. When albumin and globulin receptors are empty, they send a chemical signal to the pituitary gland, which releases these luteinizing and follicle stimulating hormones in response. These hormones stimulate the testicles (or ovaries, in the case of women) to produce testosterone. As such, the pituitary gland and sex organs

must work in perfect harmony in order to regulate testosterone production.

Resistance exercise and physical activity lead to muscle growth by actually causing trauma to the muscle fibers themselves. Once this occurs, the body responds by repairing the tissues and adding new protein strands through a process called protein synthesis.

Testosterone plays an integral role in this as it binds to receptors in the muscles themselves, then works to improve the chemical signals that result in protein synthesis. The more free testosterone in your body, the more efficient this process becomes. Many bodybuilders supplement with synthetic testosterone to increase these free hormone levels.

Understanding Normal Testosterone Levels

Testosterone is commonly prescribed to men who demonstrate symptoms of a condition called Low-T. These symptoms are the result of too little testosterone in the bloodstream, and they can range from chronic fatigue to weight gain. If you demonstrate medical need for testosterone, you will receive a prescription for injectable, oral, or topical hormones as therapy. Bear in mind that “normal” testosterone levels can vary by age, as well. The chart below demonstrates this normal total and free testosterone levels in

different age groups measured in nanograms per deciliter.

Testosterone Dosage and Warnings

Testosterone dosages vary based upon the reasons you use it and the type of testosterone you have available to you. You can find testosterone injections and testosterone pills, and doses are much different for those who need testosterone therapy for medical reasons than they are for athletes. Women should never supplement with testosterone unless under a physician's orders.

Testosterone Type	Replacement Therapy	Performance Enhancement
Testosterone Cypionate	50mg to 400mg Every 2-4 weeks	250mg to 800mg per Week
Testosterone Enanthate	50mg to 400mg every 2-4 weeks	400mg to 750mg per Week
Testosterone Undecanoate	Initial 750mg injection followed by maintenance dosing with oral tablet (40mg to 60mg/day)	Up to 240mg per Day
Testosterone Propionate	n/a	50mg to 100mg Every Other Day

Testosterone undecanoate is the only pill form; the rest are injections. If you obtain your hormones from your physician, you may also find that your pharmacy carries testosterone gel or perhaps testosterone cream. Although these preparations are great choices for men who need replacement therapy, they are not good choices for athletes because of the amount of product required to obtain the optimal dose. Furthermore, while testosterone propionate is the most popular type among

athletes, physicians no longer use it to treat the symptoms of low testosterone because it requires frequent dosing and is harsher than the other forms.

None of the information provided here should take the place of medical advice. If you use testosterone for medical reasons, do not change your dose, start a new form of testosterone, or stop taking it without discussing the potential effects with your physician.

Testosterone Side Effects

As with any type of supplement or drug, you may experience some testosterone side effects as you increase your doses. High testosterone in women also causes some side effects. They include but are not limited to the following:

- Headaches
- Anxiety
- Pain and/or swelling at the injection site
- A tingling or numb feeling
- Libido changes – increased or decreased interest in sex
- Male-pattern baldness
- Increased body hair growth
- Breast swelling (gynecomastia)
- Acne and oily skin
- Bloating/water retention

In men, free testosterone converts to estrogen, which is primarily a female hormone. Just as too much testosterone can cause virilization (the development of masculine features) in women, too much estrogen can cause the opposite in men. As such, athletes who buy testosterone shots should be certain to include an aromatase inhibitor in their cycles to avoid conditions like gynecomastia and excessive bloating. There is no “safe” dose of testosterone for women, and the symptoms of virilization may be irreversible. For this reason, women should avoid it or use it with extreme caution.

Testosterone Stacks

Testosterone forms the base of many cycles since it pairs nicely with almost any anabolic steroid imaginable. For instance, men who want to improve strength and muscle growth may buy testosterone and pair it with Deca Durabolin, Trenbolone, or the ever-popular Dianabol to enjoy the synergistic effects the combination provides. Some men choose to use testosterone pellets, injections, or pills alone, as they find that simply increasing the amount of free hormone in their system is enough.

Many men like to stack testosterone with legal supplements like creatine. This adds to muscle growth, endurance, and strength without the harsh effects of anabolic steroids, and it is easier to find. Others prefer to wait until post cycle for a little extra help in the gym while their natural testosterone levels return to normal.

Testosterone Cycle

There are dozens of testosterone cycle examples out there today, so rather than focus on specific cycle options, it is best to consider a few basic requirements based on your experience with hormones and steroids.

- **New users should titrate their doses.** If you have never used a testosterone cycle before, start with a small dose and work your way up. This way, you can better gauge

your reaction. What's more, take testosterone alone rather than alongside anabolic steroids at first.

- **Consider the half-life.** Testosterone half-life varies based on the type. For example, testosterone propionate lasts only about 48 hours, so you need a more frequent dose. Conversely, testosterone cypionate and enanthate have half-lives of about 14 to 16 days, so you need less frequent dosing and an adjusted cycle length.

Testosterone PCT

Because natural testosterone production stops whenever you introduce a synthetic testosterone or anabolic steroid into your system, it is important to give your body time to recover after a steroid cycle. Without ample post-cycle therapy, it could take up to a year for normal testosterone production to resume at optimal levels. You have a couple of different choices in terms of PCT. Most bodybuilders find that an estrogen antagonist like Nolvadex or Clomid is all they need. Others will also use hCG, particularly after long cycles or cycles with high doses of very powerful steroids like Dianabol or Trenbolone.

Determining how and when to start PCT after using synthetic testosterone depends on the type of testosterone you used. For example, Testosterone Undecanoate and Testosterone Propionate have very short half-lives, so you should start three days after the close of your cycle. On the other hand, Testosterone Cypionate and Enanthate have long half-lives, so you should wait 10 days after you take your last dose of synthetic testosterone. If you included an anabolic steroid, always consider the longest half-life of your cycle components. For instance, if you used Testosterone Undecanoate (short half-life) and Trenbolone Hexhydrobenzylcarbonate (long half-life), you would wait 10 days

after your last cycle day to begin your PCT.

If you will use hCG, you should use this first. You will take the hCG in doses of 500iu to 1000iu for 10 days, and then switch to the Clomid at 150mg or the Nolvadex at 40mg for another four to six weeks, cutting the dose in half every two weeks. If you will not use hCG, simply skip this part of the PCT and start the Clomid or Nolvadex three or 10 days following your cycle end, depending on the compounds you used during that cycle.

Testosterone Results

Most people want to know what they can expect after a cycle or with long-term use before they buy testosterone, and rightly so. The results you can expect will vary based on many unique factors, including your goals. For example, if you want to buy testosterone online to combat the effects of naturally low testosterone, you will typically need a relatively small dose of testosterone. On the other hand, if you are looking for testosterone injections for sale for performance enhancement, your results will depend on the type of testosterone you buy, your dose, your diet, and your workout plan. You will also need a much larger dose than is recommended for hormone replacement. Remember that steroids or hormones alone cannot provide you with the results you want; you will need to commit to some lifestyle changes, as well.

When you use exogenous testosterone for hormone replacement therapy (HRT), and when you follow the dosage guidelines carefully, you can expect to start feeling stronger and more energetic within the first week or two. If you pair your HRT with a healthy diet and exercise plan, there should be noticeable fat loss (and muscle gain, in some cases) within the first four to six weeks.

If you want to buy testosterone for performance enhancement, you will need to carefully consider the options available to you, and you will need to use the right dose according to recommendations.

Testosterone can provide a boost to your strength and stamina when used in larger doses, and if you pair it with a high-calorie, high-protein diet and strength training, you could gain five to 10 pounds of lean muscle mass in a 16-week cycle. You may experience even better testosterone results if you stack it with an anabolic steroid.

Is Testosterone for Sale Legal?

In the United States, you can only buy legal testosterone with a prescription. Otherwise, it is illegal to possess or use it. In some countries, such as Mexico and in parts of Europe, you can purchase over the counter testosterone products in almost any pharmacy. Before you buy testosterone online or otherwise, make sure that you understand the implications. Many of today's competitions test athletes for high levels of testosterone, as well. Keep in mind that failing a testosterone test may get you banned from certain events, and it may come with legal consequences.

Testosterone Boosters

If you would rather try to increase testosterone naturally, you could try a natural testosterone booster. These Test for sale products contain ingredients designed to boost the production of testosterone in your body rather than introduce more. Often, they contain a compound known as *tribulus terrestris*; men around the world have used it for generations to improve libido. Although there are only limited scientific studies and the results are inconclusive, millions of men across generations cannot be wrong. Today, the most positive testosterone booster reviews

focus on compounds that contain this popular ingredient.

You need to take things to the next level and incorporate a supplement or a legal steroid into your process. If you're not sure where to start, consider testosterone. The physical reformation that can occur when you use one of the best testosterone

supplements on the market is a great starting point. Testosterone boosters will make a huge difference in your workout and your body.

Testosterone Pills

When you increase testosterone levels in your body, you grow. It's a natural hormone that your body produces and when you take male testosterone pills or male testosterone supplements, those products give your body a jump start in creating and using that valuable hormone. Think of it as a power surge zapping through your entire body. You'll be bigger, stronger and fiercer when you take natural testosterone boosters because your body will respond the same way it would respond to the actual hormone. You will increase your capacity for exercise and lifting. By doing more, you'll be able to build more. Muscles will grow and expand and you won't have any problem keeping up with the demands of even the most intense workouts. The best testosterone supplement will reliably mimic what your body naturally does on its own. Therefore, the supplement is working with your body instead of against it.

Testo-Max

One of the top testosterone boosters on the market is testosterone max. This product is produced, supplied and sold by Crazy Mass and you won't be disappointed with the results. It's one of the best testosterone pills you'll be able to find, and it's easy to buy and easy to use. Reading the testosterone max reviews, you'll know that bodybuilders at all levels find this to be the best testosterone booster. The difference will be noticed very quickly: leaner muscle mass, stronger lifting power and an increased energy level. If you've been looking for something to push you past a plateau or over the finish line of your bodybuilding goals, you're going to love it. This testosterone is for serious

weightlifters who want to lift more, build more and grow more.

What To Expect from Testo-Max

If you've never had experience using testosterone pills for men, prepare yourself for a big change in how you look, feel and workout. That extra motivation and energy will come from the higher hormone levels and increased stamina that you've gained. There is a lot of extra potential that you can easily grab. Getting stronger naturally, with herbal testosterone supplements, is the best, safest and healthiest way to grow your muscles. Here's what you can expect:

1. Protein synthesis will be easier for your body, allowing muscle gains that you were previously unable to achieve.
2. The blood flow to your muscles will increase thanks to this product's ability to help you with nitrogen retention.
3. You'll have less stress and more motivation. Instead of worrying and wishing, you'll get to the gym and do your work.
4. The recovery process will be greatly improved. With greater muscle density and stronger form all around, your muscles will be able to rest and recover in record time, getting you back to the gym and back on track even faster.
5. Body fat will not be a problem. It can be challenging to gain muscle but not fat. However, the best testosterone boosters allow you to put on lean muscle and burn off the fat you don't need. You'll look as great as you feel.
6. Finally, your sex drive will increase with higher levels of testosterone. This is certainly not a bad side effect – for you or your special someone.

You don't have to worry about any unpleasant side effects. Anabolic steroids get a bad reputation when it comes to toxic damage that can be done to your liver and kidneys. However, the max testo product takes the best anabolic properties and the best androgenic properties to create a supplement that gives you all the benefits but none of the side effects. It's safe.

How to take Testo-Max

Lots of people stay away from steroids or steroid supplements because they worry about needles and injections, or they fear they won't be able to get a prescription. Luckily, it's very easy to buy these natural testosterone pills. There is nothing to inject; they come in capsule format so that all you have to do is pop a few pills orally. Get yourself on a time schedule so you know exactly when to take them, because you don't want to forget. You'll want to take a tablet two or three times per day, ideally with meals. You're getting twice the concentrated testosterone as you get with other supplements, and taking it with food will help deliver its power to your bloodstream and your muscles faster.

When you take it on days that you're planning to workout, try to administer a dose about half an hour before you start working out. Try it for at least two months to get a reliable idea of what kind of results you can expect.

The testo-max product is the ideal testosterone supplement for anyone who is trying to build muscle while burning fat. Within weeks, you'll notice yourself accessing more power and strength at the gym, and you'll be stronger and bigger as a result. It's a safe and legal steroid and one of the best products on the bodybuilding market. Give it a try and see what kind of outrageous results you can achieve.
